

MULTI-STAIN REMOVER & METAL GONE

Treats metal build-up in water and on pool surface

Safe. Powerful. Amazingly Effective.

Iron stains appear as brown or rust discoloration. Copper stains look like blue, grey or black spots. Black spots can also be stains from manganese. Organic stains, commonly from leaves or tree fruit, often retain the color and shape of the object. If a stain is not caused by algae, chances are it is a metal stain. Use Lo-Chlor Multi-Stain Remover as an over-all treatment or as a spot treatment to remove stains and treat with Metal Gone to prevent further staining.

- Works on metal & organic stains
- Triple-strength, concentrated formula
- Use on cement, fiberglass & vinyl liner pools
- Removes iron, copper, rust & manganese stains

Use Together For Best Results

- Excellent for pool start-up
- Regular use prevents new stains
- Sequesters & removes metals from pool water

Metal in pool water can fall out of solution and adhere to pool surface. This is how metal stains form. To remove metals, Lo-Chlor Metal Gone sequesters the particles from the pool water and chelates, or encapsulates, them until they are safely filtered out so they cannot dissolve back into the pool water to stain. Lo-Chlor Metal Gone also aids in scale removal and prevention. Regular use prevents the deposit of new stains and will continue to reduce older metal stains.
